BRB Audio To MIDI Env

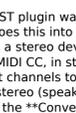

BRB Audio to MIDI Env (BRB Audio to MIDI) is a plugin based on the BRB Audio Engine, an easy to use high quality audio effects synthesizer featuring 20 multimode filters and 5 multichannel resonant filters. It produces a quantized output signal suitable for MIDI processing, in the form of MIDI CC. The BRB Audio to MIDI Env plugin is intended to be used with the BRB Audio Engine as well as with any other producer that is equipped with a multichannel audio input and outputs. The BRB Audio to MIDI Env plugin can be used to generate MIDI CC in all major event types and channel types for any arbitrary audio input. A number of additional features can be added to the plugin's MIDI CC generation capability, such as the following: • Automatically calculate and apply soft panning • Generate MIDI CC with MIDI velocity • Allow MIDI CC generation from unprocessed audio input • Allow MIDI CC to use channel numbers in the audio input signal • Allow MIDI CC to use MIDI channel number and clock divisions • Assign data points to any number of MIDI CC channels • Split selected MIDI CC channels into multiple MIDI CC channels • Separate unipolar to bipolar conversion • Per-channels polarity reversal • Automatically calculate and apply volume adjustments

Note: BRB Audio to MIDI Env is a simple software tool, no audio hardware is needed. Features: • Multichannel support • Intuitive, easy to use graphical user interface • Quantized output of 12-bit integer audio data • Support for stereo inputs • Support for 16-bit/24-bit audio signals • Support for 32-bit/64-bit audio signals • Support for 32-bit/64-bit audio data in the audio input signal • Support for arbitrary number of bit-depth audio input channels • Stereo audio playback • Per-sample polarity detection • Waveform shape detection • Direct audio input connection (no audio hardware is needed) • Sample rate conversion from one sample rate to another • Automatically calculate and apply soft panning for all channels • Automatically calculate and apply volume adjustments • Automatically calculate and apply transpose and scale settings • Automatically detect input signal's waveform shape and automatically determine/generate MIDI CCs • Generate MIDI CC with MIDI velocity • Generate MIDI CC from unprocessed input b7e8df5c8

BRB Audio To MIDI Env For Windows

Convert any audio signal into MIDI, an essential tool for any musician, for a high level of flexibility. Works in 16 bit/44.1 kHz and 24 bit/192 kHz resolution. Works with almost any recording software and hardware. Works with VST and AU plugins. The user can select any audio signal input as the input audio for the plugin. The plugin will play any audio source through the host's audio interface or any sound device. The plugin will adaptively select the most suitable audio input for the audio source. Volume control: The audio input device's volume may vary over time and will not be fixed. The plugin will automatically set the audio input to an appropriate level, based on the input audio volume. Automation: The user can synchronize the audio input device's control input (for example, a MIDI controller) with the plugin's control output and automate the plugin's control output in response to the control input of the audio input device. While the audio input device is sending control signals, the plugin will adaptively send MIDI CC. In other words, the plugin will receive the control output of the audio input device and also transmit the same control output to the plugin's control output if and only if it is a valid MIDI CC. The user can automate the plugin's control output to adaptively respond to the control input of the audio input device. For example, the user can set a certain control input of the audio input device (for example, a MIDI controller) to control the volume of the audio input device and automatically set the volume to 100% whenever the user sends a control input for changing the volume of the audio input device. The user can also set a certain control input of the audio input device (for example, a MIDI controller) to synchronize the change in the audio input device's volume and the plugin's control output and then automatically increase/decrease the volume of the plugin whenever the user sends a control input for changing the volume of the audio input device. Perform a fade (silent or not) from any audio input signal to the plugin's control output, with the user's control input to the audio input device set to a fixed value. 8 Lanes supports dynamically setting the plugin's L/R outputs to be either active or silent. The user can enter the plugin's control output in one of the eight lanes in 8 Lanes to determine the midi channel that the user wants to work with
